

Objects, Properties and Methods

Lab Answers

Q8: Using **properties** of get-timezone, get the current time zone where you live.

Answer

- First, we need to find the correct command
- Type get-command *timezone*
- The command we need is Get-Timezone
- To get the property of get-timezone
- Type get-timezone | gm
- In the list there is a property called DayLightName. Let's try that one.

I'll type out the command then explain what I did.

- Type (get-timezone).daylightname
- To use a **property** of an object, Place the cmdlet name in parenthesis, then type a dot (.), then the property name and press return
- And there's our time zone Eastern Daylight Time

Q9: Using the **properties** from get-wmiobject, let's get the bios version of your computer.

Answer

- Type get-wmiobject win32_bios | gm
- BTW Win32_BIOS
- Is a WMI class that represents the attributes of the computer system's basic input/output services or BIOS. Press return
- Displayed are all the properties. We will use BIOSv ersion
- Type cls - return

- Type `(get-wmiobject win32_bios).biosversion` press return

And displayed is the bios version of my computer
